

The NFT Space will never be the same again...

FibPal

FibPal is a payment application specifically designed and engineered for NFT marketplaces. Developed by FibSwap. One that will allow for payments across multiple chains, in a completely full-proof, decentralized manner, through their interoperable multichain bridge system.

This application will expose NFT Marketplaces to the entirety of the crypto market, for all token holders, in a decentralized manner.

About FibSwap

FibSwap is an interoperable, multichain, decentralized exchange that allows for purchasing, selling and swapping tokens from different chains through their technology. The DEX allows for swapping tokens between different blockchains, quickly and cost-effectively. You can swap a BNB token, with an ETH token. But it is not just BSC, and ERC20. They allow for swaps between ERC20, Polygon, Fantom, xDai, Avalanche, Arbitrum One, and BSC. With \$FIBO as their native token

The team behind FibSwap is taking their revolutionary technology to the next level, to completely transform the NFT industry. Right now, all transactions on NFT marketplaces are on-chain, single-token based, where the buyer has fewer options, and the seller has less exposure. If the seller/merchant put up their NFT for Ether, the buyer has no other option but to purchase the digital asset in Ether.

With FibPal, this will all change. FibPal will swap any token the buyer has, for the token the merchant is selling, and any buyer will have the ability to purchase any NFT, in any token, with no restrictions, and no KYC.
